J. Bacteriol. 179, 7135-7155, 1997
A; Title: Complete genome sequence of Methanobacterium thermoautotrophicum Delta H: funct
A; Reference number: A69000; MUID: 98037514
A; Accession: F69208
A; Status: preliminary; nucleic acid sequence not shown; translation not shown
A; Residues: 1-165 < AMTH>
A; Residues: B; Agentimental source: strain Delta H
C; Genetics:
A; Genetics:
A; Genetics:
A; Gene: MTH813
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gwin

```
The invention relates to human CD20/immunoglobulin E (IgE)-receptor like polypeptides designated as agp-96614-al and agp-69406-al and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating, preventing or ameliorating a disease, condition, or disorder which includes cancer such as brain cancer; abnormal cell proliferation such as arteumatoria arthritis, abronomed isease, multiple sclerosis, auch as allergies, asthma, dermatitis; dysfunction of immune system such as theumatoria arthritis, autofimmune diseases, multiple sclerosis, diabetes, transplant rejection and reproductive diseases such as infertility, preterm labour and delivery, endometriosis etc. They are also useful for identifying antagonists and as immunogens, for raising antibodies which may also be used to prevent, treat or caisends an number of diseases and disorders. Polynucleotides of the invention are used to map the location of CD20/IgE-receptor like protein, agp-96614-al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TFSFGVIFLFTLLKPYPRFPFIFLSGYPFWGSVLFINSGAFLIAVKRKTTETLIILSRIM 120

potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENGST gene expression. For example, they be used to treat disorders associated with decreased GENGST gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisease nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisease nucleic acids may also be created as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and an assays to identify modulators (agonists and an assays to identify modulators (agonists and an assays to identify modulators (agonists) of GENSET polypeptide expression and activity. The Full length GENSET human nucleic acids encoding potentially secreted proteins, useful in gene therapy and vaccination against a variety of 61 TFSFGVIFLFTLLKPYPRFPFIFLSGYPFWGSVLFINSGAFLIAVKRKTTETLIILSRIM 120 121 NFLSALGAIAGIILLTFGFILDQNYICGYSHQNSQCKAVTVLFLGILITLMTFSIIELFI 180 Gaps 1 MDSSTAHSPVFLVFPPEITASEYESTELSATTFSTQSPLQKLFARKMKILGTIQILFGIM 60 The invention relates to full length GENSET human nucleic acids ö protein; membrane receptor; IgE receptor; CD20; Length 200; Indels DB 22; Jobert S; 100.0%; Score 1027; DB 22; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                         Human membrane protein #1 is 1 of 4 human membrane proteins
(AAMO1210-AAMO1213) given in the present invention. These membrane
proteins share structural similarity with membrane receptors such as
the 1gf receptor and mammalian CD20. The novel human membrane proteins
are useful for identifying agonists, antagonists and modulators of the
membrane proteins, and for producing antibodies specific to the
membrane proteins. The membrane proteins can be used for diagnosis,
and the treatment of physiological disorders and diseases. The
polynucleotides encoding the membrane proteins can be used to generate
polynucleotides encoding the membrane proteins can be used to generate
per primers or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 TPSFCVIFLFTLLKPYPRFPFIFLSGYPFWGSVLFINSGAFLIAVKRKTTETLIILSRIM 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               neurological disorders (ischaemic lesions). Immune-system related protein neurological disorders (ischaemic lesions). Immune-system related protein or DNA is useful for preventing hair loss, skin aging due to sunburn, to maintain organs before transplantation, to treat weight disorders, to modulate mammalian characteristics, to change a mammal's mental or physical state, or as a food additive or preservative. Immune-system related DNA is useful in gene therapy, for chromosome identification, radiation hybrid mapping, long range restriction mapping and in forensic biolog. The present sequence represents a human immune-system related protein of the invention.
                                                                   The invention relates to human immune system-related protein and their preventing, treating or amelicating a medical condition in a mammalian subject, for diagnosing, preventing a medical condition in a mammalian disorders, autoimmune disorders (rheumatoid arthritis), inflammatory disorders (allergies), immunodeficiencies (ALDS), inflammatory disorders (allergies), immune complex diseases, neoplastic disorders (cancer), hyperproliferative disorders (Gaucher's disease), disorders associated with neovascularisation, diseases at the cellular level, cardiovascular disorders (allergies), wound healing and epithelial cell proliferation, endocrine disorders (diabetes mellitus) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Human membrane protein #4 is 1 of 4 human membrane proteins the proteins and membrane protein in the present invention. These membrane proteins share structural similarity with membrane receptors such as the igs receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and medulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate per primers or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 TFSFGVIFLFTLLKPYPRFPFIFLSGYPFWGSVLFINSGAFLIAVKRKTTETLIILSRIM 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 NFLSALGAIAGIILLTFGFILDQNYICGYSHQNSQCKAVTVLFLGILITLMTFSIIELFI 180

Tang YT, Liu C, Drmanac RT;

WPI; 2001-457740/49. N-PSDB; ABA09478. Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer -

Claim 20; Page 318; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and compares ABB1098125-ABB109574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides. CC antibodies against the polypeptides of identifying compounds which co polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence co potential therapeutic applications. The polypeptides of the invention may differentiation activities; stem cell growth factor activity; the invention activities is the cell growth activity; cc differentiation activities; stem cell growth activity; communication activities; haemostatic, thrombotic or immunomodulatory activity; activities; haemostatic, thrombotic or thrombolytic activities; receptor or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Cc charactic or themokinetic activities; polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical cancers, haematopoletic disorders (e.g., asthma or arthritis), conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., asthma or arthritis) arterial and fungal infections in addition to immune disorders.

Cc bacterial and fungal infections in addition to immune disorders.

ö Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides screening techniques. The present sequence represents a novel human polypeptide of the invention. Human membrane protein #3 is 1 of 4 human membrane proteins (AAU01210-AAU01213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the Gaps 1 MDSSTAHSPVFLVFPPEITASEYESTELSATTFSTQSPLQKLFARKMKILGTIQILFGIM 60 Polynucleotide encoding novel human membrane protein, useful for identifying agonist, antagonist or modifiers or for producing antibodies useful in therapeutic, diagnostic and pharmacogenomic The present sequence represents novel human membrane protein #3 ö Human; membrane protein; membrane receptor; IgE receptor; CD20; Length 158; 1; Indels DB 22; Score 687; DB 22 Pred. and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate PCR primers or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisanse nucleic acid molecules may be administered to down regulate their expression. The sense and antisense nucleic acids mutations by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids sequences in samples, and hence to determine which patients may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and activity. The canadidates and in assays to identify modulators (agonists and massays to identify modulators (agonists and massays to identify modulators (agonists and present sequence is a GENSET polypeptide expression and activity. The present sequence is a GENSET polypeptide of the invention.

High affinity immunoglobulin E receptor-like protein; IGERB; Incyte clone 927955; inflammatory response; AIDS; Addisons's disease; atherosclerosis; bronchitis; ulcerative colitis; diabetes mellitus; emphysema; gout; Garves's disease; osteoporosis; rheumatoid arthritis; Sjogren's syndrome; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a high affinity immunoglobulin E receptor-like protein (IGERB). The present sequence was first identified in Incyte clone 927955 for the brain cDNA ilbrary BRAINOTO4. POLYNUCleotides complementary to the IGERB CONA can be used as probes to IGERB gene expression. IGERB proteins and nucleotides may be used for the diagnosis of inflammatory responses associated with expression of IGERB, e.g. AIDS, Addisons's disease, atherosclerosis, bronchitis, ulcerative colitis, diabetes mellitus, emphysema, gout, Garvee's disease, osteoporosis, rheumatoid arthritis, Sjogren's syndrome and complications of cancer. The sequences may also be useful in assays that detect activation or

consensus. An allergic response is initiated by release of IgE
from B Lymphocytes. The IgE molecules then bind to the high affinity
CC IgE receptor (FCRI) present on mast cells and basophils, which triggers
the release of histamine and proteases from cytoplasmic granules and
case to the synthesis of effectors of the allergic and inflammatory
leads to the synthesis of effectors of the allergic and inflammatory
cc response, such as prostaglandins, leukotrienes and cytokines. As IGERB
CC binds IgE, it may be administered to stimulate allergic and immune
cr responses in patients in whom IGERB is under expressed or inactive and
cr supplement the patients own production of the protein. IGERB may also
be used as an antigen for the production of antibodies and to identify
candidate agonists and antagonists of IGERB expression and activity.
The antibodies may also be used in diagnosis. Antibodies and antagonists
cm be administered to downregulate IGERB activity and reduce the
complement of inflammatory and allergic responses. They may be used in this
way to treat inflammatory disorders such as multiple sclerosis,
caponists may be used to enhance immune responses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ğ
                                                                                                                                                                                                                                                                   AAA AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898 to AAY94890, isolated from human adult brain, adult thyroid, adult retina, foetal carcinoma, adult blood, adult neural, foetal kidney, adult placenta, adult testis, whole embryo, adult cartilage, kidney, coult placenta, adult thereis, whole embryo, adult uterus, adult tumour, and adult bladder, confalibrates, The polynucleotides and proteins are predicted to have blological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. The polynucleotides can be used as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on Southern gels, and as chromosome markers or to map gene positions. The proteins can be used in the treatment of immune deficiencies and disorders, such as severe combined immunedeficiency (SCID), as well as viral, bacterial, fungal and other infections. These infections include human immunodeficiency virus (HIV), hepatitis, herpesviruses, mycobacteria, Leismania spp., malaria and candidasis. The proteins can be used to treat autoimmune disorders such as connective tissue disease, multiple sclerosis, systemic lupus cultimanted inflammatorid arthritis graft, versus host-disease and calabetes mellitus, myssthenia gravis, graft-versus host-disease and cultimanne inflammatory eye disease. The proteins can also be used to treat allergic conditions, such asthma. AAA16698 to AAA16774 represent probes for the human secreted proteins from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been clones. 830 cDNA molecules sequences of 5'- and 3'-ends of the CDNA molecules have been determined. Finance: for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA assity without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primers useful for synthesizing full length cDNA clones and their in genetic manipulation

Patent No. 5705615
GENERAL INFORMATION:
GENERAL LIM, Bing
APPLICANT: Lim, Bing
APPLICANT: Lim, Chaker N.
APPLICANT: Lelias, Jean-Michel
TITLE OF INVENTION: RECOMBINANT HIM4 GENE, PROTEIN AND
TITLE OF INVENTION: ASSAYS
NUMBER OF SEQUENCES: 4
    SOFTWARE: PatentIn Release #1.0, Version #1.25
                                                                  FILING DATE:
CLASSIFICATION: 530
ATTORNEY/AGENT INFORMATION:
NAME: Brock David E.
REGISTRATION NUMBER: 22,592
REFERENCE/DOCKET NUMBER: BIH94-03
TELECHONUS. (617) 861-6240
TELECHONE: (617) 861-9540
INFORMATION FOR SEQ ID NO: 3:
SEQUENCE CHARACTERISTICS:
LENGTH: 1661 base pairs
TYPE: nucleic acid
STRANDENESS: single

```
The invention trades or numman CDENTA immunostroutin E 1995. techeptor. The invention are assignated as agp-96614-al and agp-69406-al and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating, preventing or ameliorating a disease, condition, or disorder which includes cancer such as disease, condition, or disorder which includes cancer such as retrained cancer, ovarian cancer, abnormal cell proliferation such as uch as allergies, ascular restenosis; pathology from allergens such as allergies, ascular restenosis; pathology from allergens such as rheumatoid arthritis, autoimmune disease, multiple sclerosis, diabetes, transplant rejection and reproductive diseases such as infertility, preterm labour and delivery, endometriosis etc. They are also useful for identifying antagonists and as immunosens, for raising antibodies which may also be used to prevent, treat or largnose a number of diseases and disorders. Polynucleotides of the invention are used to map the location of CD20/INGE-receptor like gene and related genes on chromosomes and as hybridisation probes. They are also useful in gene therapy. The present sequence is human CD20/INGE-receptor like protein encoding CDNA, agp-96614-al.
                                                                                                                                                                                                                                Novel CD20/IgE-receptor like polypeptides and polynucleotides, antagonists and antibodies of the polypeptide useful for treating ameliorating or preventing diseases associated with the polypeptide e.g. cancer, asthma
                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human 	ext{CD20/immunoglobulin E} (IgE)-receptor
                                                                                                                                                                                                                                                                                                                                                             Claim 1; Fig 1; 145pp; English.

potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GRNSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy.
                                                                                                                      099
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; secreted protein; gene therapy; vaccine; treatment; diagnosis;

Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition
                                                                                                                                                                                                                                    Gaps
                                                                                                                              The present invention provides the protein and coding sequences of number of human reproductive system related antigens. These can be in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a coding sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tttggagttatcttccttttcactttgttaaaaccatatccaaggtttccctttatattt

Human immune-system related protein and DNA are useful for DNA. Human immune-system related protein and DNA are useful for CC DNA. Human immune-system related protein and DNA are useful for Subject, for diagnosing, preventing or treating immune system-associated disorders, autoimmune disorders (theumatoid arthritis), inflammatory disorders (allergies), inmunodeficiencies (ADDS), inflammatory disorders (allergies), infectious diseases (e.g., viral hepatitis), complement activation disorders, immune complex diseases, neoplastic disorders (cancer), hyperproliferative disorders (Gaucher's disease), disorders (cancer), hyperproliferative disorders (Gaucher's disease), disorders (cancer), hyperproliferation disorders (daubetes melling and epithelial calforders (larhythmiss), wound healing and epithelial cell proliferation, endocrine disorders (diabetes mellitus) and cell proliferation, endocrine disorders (diabetes mellitus) and cor DNA is useful for preventing hair loss, skin aging due to sunburn, to maintain organs before transplantation, to treat weight disorders, to modulate mammalian characteristics, to change a mammall s mental or physical state, or as a food additive or preservative. Immune-system related DNA is useful in gene therapy, for chromosome identification, radiation hybrid mapping, long range restriction mapping and in forensic

                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                        The present sequence encoding for a novel human membrane protein includes the flanking 5' and 3' sequences. Four amino acid sequences for novel human membrane proteins (AANO1210-AANO1213) are given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonist, antagonist and modulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins can entibodies for diagnosis, drug screening, pharmacogenomic applications, and diseases. The polynucleotides encoding the membrane proteins can be used to querrate PCR primers or probes to identify mutations associated

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which

CC potypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutica applications. The polypeptides of the invention may differentiation activities, including cytokine, cell proliferation or cell differentiation activities; including cytokine, cell proliferation or cell differentiation activities; attem cell growth factor activity; haematopolesis regulatory activity; tissue growth activity; haematopolesis regulatory activity; tissue growth activities; compact or chemotries; receptor or ligand activities; or may be conditions on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders, bone disorders (e.g., wyeloid or lymphoid cell cancers, haematopoletic disorders (e.g., wyeloid or lymphoid cell acterial ischaemia, bone disorders (e.g., will or lymphoid cell vascular growth. Polypeptides may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with conditions to mimunomodulatory activities may be used in the treatment of viral, immunomodulatory activities may be used in the treatment of viral, companied with growth. For example, such polypeptides may be used to commote veller cells of promote cell growth. For example, such polypeptides may be used to commote the polypeptides with growth factor activity may be used in cell cells of manipulate stem cells in culture to give rise to neuroepithelial cells and purgal to remore the cells of remored to re autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention. to polypeptides of the invention. Although novel, many of the can be used to augment or replace cells damaged by illness, that

The present sequence encodes for novel human membrane protein #1. Human membrane proteins (AAU01213) given in the present invention. These membrane proteins proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins. The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, cidical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate polynucleotides encoding the membrane proteins can be used to generate polynucleotides encoding the membrane proteins can be used to generate profession or probes to identify mutations associated with a particular
Polynucleotide encoding novel human membrane protein, useful for identifying agonist, antagonist or modifiers or for producing antibodies useful in therapeutic, diagnostic and pharmacogenomic applications

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain uniformal procedures and to design expression and secretion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate polynucleotides or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes for novel human membrane protein #4. Human membrane protein #4 is 1 of 4 human membrane proteins (AAU01210-AAU01213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, and managonists and membrane proteins membrane proteins. The membrane proteins can be used for diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              aaattatttgctagaaaaatgaaaatcttagggactatccagatcctgtttggaattatg 277

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes for novel human membrane protein #3. Human membrane protein #3 is 1 of 4 human membrane proteins (AA001210-AA001213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the igE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins are used for diagnosis, drug screening, pharmacogenomic applications, calliforal trial monitoring and the treatment of physiological disorders and diseases. The

                                                                                                                                                                                                                                                                      The present sequence encodes for novel human membrane protein #2. Human membrane protein #2 is 1 of 4 human membrane proteins (AAUO1210-AAUO1213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins

are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate PCR primers or probes to identify mutations associated with a particular

potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased cannot be used to treat disorders associated with decreased gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression by binding with the cells' own genes and preventing their expression by binding with the cells' own genes and preventing their expression by binding with the cells' own genes and preventing their expression in diagnostic assays to detect and quantitate the used as DNA probes in diagnostic assays to detect and quantitate the determine which patients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antagonists of GENSET polypeptide expression and activity. The present sequence is a GENSET nucleic acid of the invention.
                        invention relates to full length GENSET human nucleic acids encoding

AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898 to AAY94890, isolated from human adult brain, adult thyroid, adult retina, foetal carcinoma, adult blood, adult neural, foetal kidney, adult placenta, adult testis, whole embryo, adult cartilage, kidney, adult placenta, adult testis, whole embryo, adult cartilage, kidney, feetal brain, adult thymus, foetal placenta, adult uterus, adult tumour, and adult bladder, cDNA libraries. The polynucleotides and proteins are predicted to have bloiogical activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. The polynucleotides can be used as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on Southern gels, and as chromosome markers or tags to identify chromosomes or to map gene positions. The proteins can be used in the treatment of immune deficiencies and disorders, such as severe combined infections. These infections include human immunodeficiency virus (HIV), hepatitis, herpesviruses, mycobacteria, Leismanda spp., malaria and candidiasis. The proteins can be used to treat autoimmune disorders such as connective tissue disease, multiple sclerosis, systemic lupus erythematosis, rheumatoid arthritis, autoimmune pulmonary inflammation, diabetes mellitus, myasthenia gravis, graft-versus-host-disease and cautoimmune inflammatory eye disease. The proteins can also be used to treat allergic conditions, such asthma. AAA1674 represent

BRAINOTO4. Polynucleotides complementary to the IGERB CDNA can be used as probes to IGERB gene expression. IGERB proteins and nucleotides may be used for the diagnosis of inflammatory responses associated with expression of IGERB, e.g. AIDS. Addisons's disease, atherosclerosis, bronchitis, ulcerative colitis, diabetes mallitus, emphysema, gout, Graves's disease, osteoporosis, rheumatoid arthritis, Sjoyren's syndrome and complications of cancer. The sequences may also be useful in assays that detect activation or

rinis sequence represents cuona encounia numbin attinity immunopticularia sequence represents cuona encounia numbin attinity identified in a brain cDNA library, this sequence being a consensus. An allergic response is initiated by release of TgE consensus. An allergic response is initiated by release of TgE consensus. An allergic response is initiated by release of TgE crom B lymphocytes. The IgE molecules then bind to the high affinity igE receptor (FoRI) present on mast cells and basophils, which triggers the release of histamine and proteases from cytoplasmic granules and least to the synthesis of effectors of the allergic and inflammatory response, such as prostaglandins, leukotrienes and cytokines. As IGERB binds IgE, it may be administered to stimulate allergic and immune to supplement the patients own production of the protein. IGERB may also be used as an antigen for the production of the protein. IGERB may also be used in diagnosis. Antibodies and antagonists of may be administered to downregulate IGERB activity and reduce the may be administered to downregulate IGERB activity and reduce the content inflammatory disorders such as multiple sclerosis, esteoarthritis, asthma and some complications of cancer. Conversely, the agonists may be used to enhance immune responses.

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* Will be sequenced to completion. In the event that

* the record is updated, the accession number will

                                                                                                                                                                                                                                                                   Submitted (01-APR-2000) Whitehead Institute/MIT Center for Research, 320 Charles Street, Cambridge, MA 02141, USA On Aug 18, 2000 this sequence version replaced gi:7382629. All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RW/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19530: gap of 100 bp 101314: contig of 684 bp in length 15 10314: gap of 100 bp 100 bp 10980: contig of 666 bp in length 11080: gap of 100 bp 100 bp 11080: gap of 100 bp 1183: contig of 703 bp in length 183: gap of 100 bp 12582: contig of 699 bp in length

It currently consists of 5 contiss. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contiss are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Center clone name: 24_D.1
